 Re: Vitality measurements some BIOJWLS

I was offered three BIOJWLS by Aad van der Starre to measure their energetic quality. It concerns an earring and two pendants. See Figure 1.

After measurement, there appear to be energetic differences when using different colors. Purple scores better than dark green.

Five energetic parameters are presented here, determined by the radiesthesia method:

1. The Bovisvalue, the biophysical energy content
2. The Positivity of this Bovisvalue
3. The Intention of the Producers
4. The Presence of Negative Information in the BIOJWLS
5. The Electromagnetic Pollution in the BIOJWLS

Figure 1: the three different BIOJWLS

		earring transparent earring 12 mm dot 12 mm	pendant green pendant 20 mm dot 12 mm	pendant purple pendant 20 mm dot 12 mm
1	The Bovisvalue	410,000	438,000	474,000
2	The Positivity of this Bovisvalue	10	10	10
3	The Intention of the Producers	9.98	10	10
4	Negative Information	0.04	0.03	0.009
5	Elektromagnetic Pollution	0.0001	0.0001	0.00005

Table 1: the energetic properties of some BIOJWLS

The first parameter has been measured on the scale of Bovis. The other four parameters are measured on a scale from 0 to 10. Parameter 2 and 3 should be as close to 10 as possible. Parameter 4 and 5 should be as close to 0 as possible.
